
The paper's dataset is not available and its forecast step (minutes vs hours), rain-label method and overall-RMSE definition are ambiguous (docs/WHY_RESULTS_DIFFER_FROM_PAPER.md). Its 0.026 dB lies in the range of trivial baselines on a minute-interpolated series, not near hourly forecasting. Minute-reading values: pooled over 6 cities x 78,914 windows (results/replication_audit/minute_protocol_baselines.csv). Hourly values: 195,000 test values.
